I'd like to pass in a variable from my gulp.src() from a non-gulp file. For instance: var myVar = 'my\_value'; var sass = 'myFile.scss'; gulp.src(sass) .pipe(sass({ myVar: myVar }) .pipe(gulp.dest('./app/css'))); With the gulp.src() method there's no way of passing in variables like this. I don't want to use some kind of plugin because it would slow down my build time. Any ideas? A: Sass supports variables, not a plugin. var myVar = 'my\_value'; var sass = 'myFile.scss'; gulp.src(sass) .pipe(sass({myVar: myVar})) .pipe(gulp.dest('./app/css')); If you have a lot of variables, this

Quick access to macro editor The KEYMACRO feature allows you to create and execute macro functions. You can insert a macro function anywhere in a file. The macro function can be used to access and manipulate keyboard macros. You can define different functions to alter your projects. There are many types of macros that you could use with KEYMACRO, like: When you press: "ESC" - Back to main menu ":" - Set or get text object from edit box "\*" - Go to next object "#" - Go to previous object "Enter" - Add text after current cursor "Delete" - Delete text after current cursor "Up Arrow" - Go up one level "Down Arrow" - Go down one level "Left Arrow" - Go left one character "Right Arrow" - Go right one character You can also define custom macros to execute directly from the editor. You can define macros for the whole keyboard, or you can define macros to access your own macros, which you can access via the Macros Manager dialog. You can access the Macros Manager dialog by pressing the "i" key and typing "Macros" in the search field. There you can define new macro names and edit existing macros. Each macro can be defined to run when a specific key is pressed or to run by pressing the Enter key. You can also choose to ignore certain keys that may not be useful for certain actions. You can also create and run macros when the project file is saved. Additionally, you can access the Macros Manager dialog via the menu from the main menu. Sample macros: Create and save a file Save the project Add, remove and rename files Open the project in the Pro Designer Open the project file from the directory Rename the project file and open Change the project file extension Create the project file Show the active or old project The macros can be inserted as text, values or nested values. You can run macros as text or values and you can use the text to run values. You can also insert specific text to specific objects. The macro functions are inserted after a function name in a function block. The function block is defined in the function builder. You can find the function builder under the macro builder, which is in the Macros Builder dialog 2edc1e01e8
