Have you ever wanted your site to adapt to a phone or tablet and smaller display sizes? This is called **responsive site design**, and is something a lot of bloggers and other website creators are focusing on more and more with the rise in tablet and smartphone usage. Responsive design allows your site to pretty much look the same when it is being viewed on desktop, tablet, or smartphone, meaning visitors can easily view your website without having to adjust the spacing and fonts. Worried that this new trend is going to make your job as a designer difficult? In this tutorial, I will show you some of the benefits of responsive design. There are multiple definitions of responsive design. Websites are generally considered responsive if when they are viewed on a phone, tablet, desktops, you can still read the text without the site lagging and errors, and scrolling to see all of the content. This has become the new standard and many site owners are quickly adopting this new trend as a way to make their website look as good as it can on any screen size. In terms of development, a responsive website design is made so that it looks almost exactly the same on any phone, tablet, computer, and smart TV. In terms of usability, you will notice a significant boost of traffic as people can now view your website from anywhere and not get stuck with a mobile phone-sized version of the site. If you are a blogger, you have a huge platform to communicate on. Every time you publish a blog post, you are creating your own digital magazine. With the same **responsive design** you are creating a magazine on any screen size, meaning your readers are not going to get a phone-sized version of your blog.
